Keeping track of events

User-friendly design

Architectural design - Goals

Usability

- Intuitive design.
- Visual feedback.

<u>Performance</u>

- Reducing loading time as much as possible.
- Reduce amount of transferred data and data queries.

Modifiability

- Creating new features or extending the application shouldn't be complicated.
- Modularity.

Architectural design - Decisions

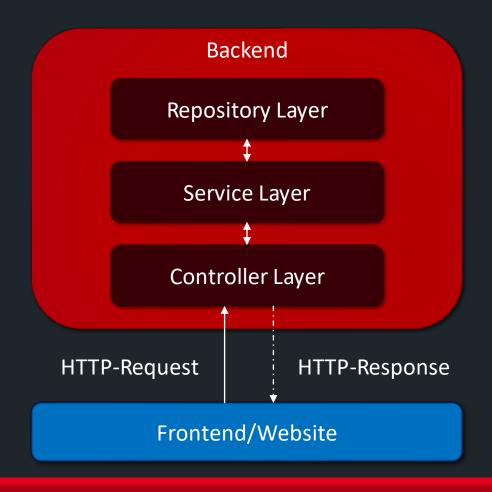

REST-architecture

Website

 Communicates with the backend through predefined interfaces e.g.
 GET /user/user-information/{id}.

Backend

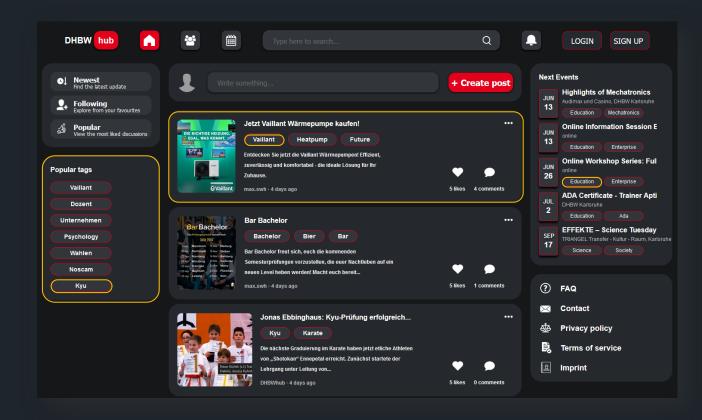

- Controller layer Data interface for the website.
- Service layer Processing of data.
- Repository layer Retrieving data from the database.
- Utility layer Data mapping and other utilities.

Architectural design - Decisions

Component-based

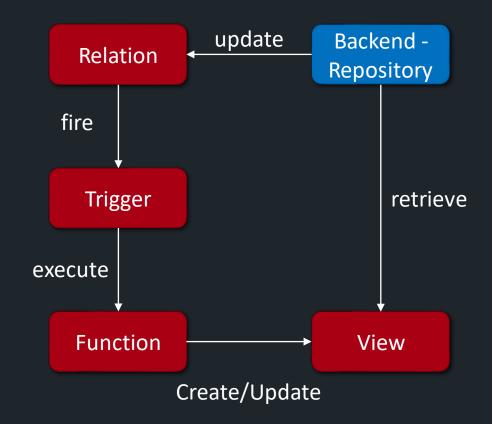

- Splitting the website into smaller components consisting of other smaller components.
- Atoms, molecules, organisms and services.
- Modular built.

Architectural design - Decisions

Database

- External Views
 - Frequent queries or calculations stored in a relation.
- Trigger
 - Executes a trigger function when a table is updated.
- Trigger functions
 - Contains the logic.
 - In our case, the creation of certain views.

Design patterns

MVC-design

- Separation of the application into model, view and controller.
- Facilitates maintenance and expansion of the application.

Single responsibility principle

- Each method has a single task.
- Increases the clarity and maintainability of the code.

Tech Stack

Quality Assurance - Testing

Backend tests

Frameworks:

- JUnit5
- Mockito
- Maven

Focus:

Correct transformation of data

Quality Assurance - Testing

Frontend tests

Frameworks:

- Jest
- React

Focus:

- Accurate rendering of objects
- Correct function-call logic

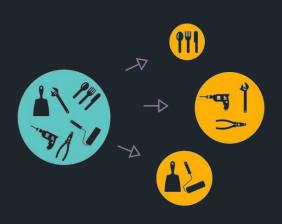

```
▶ Run npm test
> dhbw-hub@0.1.0 test
> jest
PASS src/services/tests/ProfilePictureService.test.tsx (8.202 s)
PASS src/services/tests/AuthService.test.tsx (8.21 s)
PASS src/services/tests/TagService.test.tsx (8.331 s)
PASS src/services/tests/DescriptionService.test.tsx
PASS src/services/tests/TimeService.test.tsx
Test Suites: 5 passed, 5 total
Tests:
             41 passed, 41 total
Snapshots:
             0 total
Time:
             9.45 s
Ran all test suites.
```

Quality Assurance - Testing

Database tests

Quality Assurance - Clean Code

Principle of Least Astonishement

- Methods should be selfexplanatory
- Comment code logic when needed

<u>Conventions</u>

- CamelCase
- Links divided by hyphens

Single Responsibility Principle

 Each method is responsible for one particular action

Project management – CI/CD

- Build automation and project-management tool
- Manage Dependencies and project structure

- · React Testing Library
- · Javascript testing utility
- Create end-to-end tests about React components while mocking user behaviour

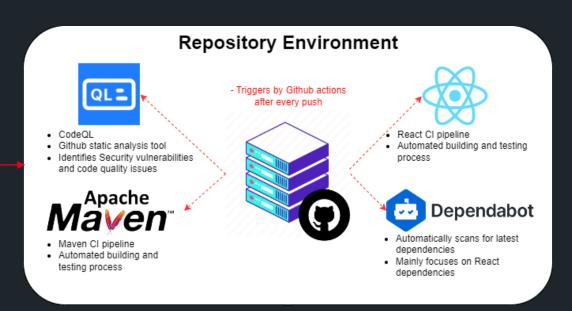

sonarlint

- Code Quality tool integrated with IDE
- Provides real-time feedback with code analysis (bugs, code smells, clean code suggestions)

- · Unit Testing Framework for Java
- Allows Parameterised Tests

Project management – Lessons learned

CI/CD is the main branch's best friend.

Diagrams help break down complex structures.

Communication is underrated.
